

Maximising Pallet Volume Efficiency

Project Implementation

Computer software is now available to help companies maximise the amount of product they can fit onto a pallet. The software can also help to maximise the amount of product placed in a case, or the amount of pallets in a truck. By inputting product weight, case dimensions, pallet type and pallet height, the best pallet solutions can be found. Cape Pack is one example of this type of software system.

Benefits of the Project

Using palletisation software:

- Assists with the design of primary, secondary and tertiary packaging
- Maximises case fills and pallet volumes
- Maximises pallet storage space
- Maximises truck fill space
- Reduces tertiary packaging
- Reduces transport costs

Issues Encountered

There are different versions of the software available depending on the complexity of packaging. Pallet Lite is a simple entry level program, where Cape Pack has much more functionality. There is also a Truck Fill program available. Repak use the Pallet Lite software and can produce examples or offer advice where required. A Pallet Lite demo CD is also available from Cape Systems.
